NEWS RELEASE

ALTIMA PROVIDES OPERATIONAL UPDATE ON CHAMBERS AREA, ALBERTA

November 14, 2007 - Altima Resources Ltd. (TSX-V Symbol: ARH) ("Altima" or the "Company") is pleased to provide an update on its operations in the gas and condensate Chambers/Ferrior area, northwest of Calgary.

Chambers/Ferrior Area, Alberta

Altima and its joint venture partner have reached a milestone in their Chambers operations by initiating natural gas and gas condensate sales from the 3-17-41-11 W5 well. During the last month, the production pipeline was completed and connected from the 3-17 well into ConocoPhillips Canada's local pipeline system, which connects with Keyera's sales pipeline system. On November 8, 2007, the 3-17 well was opened, initiating sales of gas and condensate. The well was brought on-line at a restricted rate of approximately 1.1 million cubic feet per day of gas and 50 barrels per day of condensate. The 3-17 was previously tested at over 3,000 cubic feet per day. The pipeline construction to the Company's 7-18-41-11 W5M well immediately west of the 3-17 well is scheduled to be completed in the first quarter of 2008. It was previously tested at 450,000 cubic feet equivalent per day.

As previously announced, Altima and its joint venture partner recently drilled an option well, located at 16-21-41-11 W5M, to its intended total vertical depth of 3,290 metres. Open-hole logging was performed, a production liner run, and cemented to total depth. The 16-21 encountered numerous gas shows and formations to test. Altima now plans to conduct completion operations and test the first interval in late November. Plans to lay an approximate four-mile pipeline to the 16-21 well are also under design with anticipated installation by the first quarter of 2008. This pipeline will be available for use by projected future wells in this part of the Company's acreage.

The Chambers area contains significant potential to quickly grow cash flow and reserves. Over all, this play is quickly growing toward an opportunity to drill a significant number of wells over a large acreage position in this basin-centred gas play. There are a limited number of plays today with potential to produce between 10 and 20 bscf per well, as observed in wells just to the east of Chambers. To date at Chambers we have encountered numerous potentially productive intervals in different facies, including sands, shales and carbonates.

ON BEHALF OF THE BOARD

"Richard Switzer"
